

Twin-Chem., Inc. Announces:
New Premium-Grade
Concrete/Masonry Protector

Press Release

Twin-Chem., Inc. Of Atlanta, GA announces the release of their new and revolutionary product “***Sgt Halt Concrete Protector***”.

Sgt Halt allows for ease of application combined with extraordinary effectiveness. The polymers in this product, using modern day ***nano-technology materials***, actually create a microscopic bond with the calcium carbonate that most masonry products contain. This bond protects against water, oil and many of the environmental pollutants from infiltrating the treated concrete. This is **not** a silicone technology

The end result is cleaner concrete that is less susceptible to the damage of the freeze/thaw cycle and the erosion of vertical concrete and concrete block walls.

Sgt. Halt is a water-based product that is environmentally compliant and does not contain any ozone-depleting substances. It is safe to use and dries relatively quickly.

This product effectively replaces the expensive and labor-intensive epoxy coatings that have been known to yellow over time. There is no need to hire professionals to apply ***Sgt Halt***. It can be sprayed, brushed, rolled or even mopped on. The coverage area of this product is significantly greater than most of its competition. ***Sgt Halt*** dries clear and will not yellow.

Sgt Halt is the next generation of ***premium-grade concrete protectors*** and will be available for mass distribution soon.
